Solution brief

What's New in Projectplace
February 2016

The February 2016 release of Projectplace brings several enhancements to the service. The highlights are:

- Checklists on cards

- Improvements to time reporting exports

- Easy integration with other online services

Checklists on cards

The most recent addition to Boards, the popular Kanban-inspired task management portion of Projectplace, is the ability to add a checklist on cards.

Checklists help structure the work going into completing a card, before moving it to "Done". Result: completed work is more likely to meet expectations.

Time reporting

Enhanced reports

Insight into actuals on a per-resource basis during a specific period is crucial for both project managers and line managers. The time reporting export now includes all resources in the projects you are an administrator of; if you are a line manager you can gain visibility into time reported for your team; if you are a project manager for multiple projects, it will be easier and quicker to follow up on reported time for all members.

In addition, the time reporting export now comes in an updated format, which makes sorting and filtering of information using Microsoft Excel more powerful.

Account-wide report

We have also made improvements to the account-wide summary report available to account administrators. You can now specify whether the report should include daily actuals.
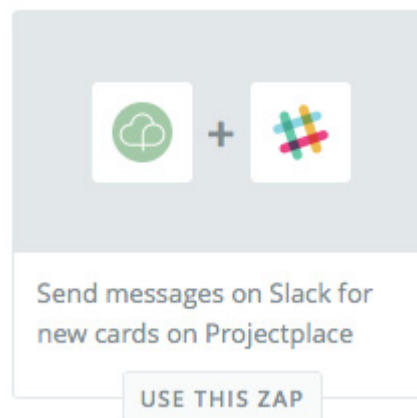

Projectplace loves the apps you love

Did you know that Projectplace can be integrated with over 500 other online services? So no matter how you work, you will get the best out of all the tools without turning them into information stovepipes.

We are now enhancing our support for Zapier, a leading platform that makes the process of setting up links between services easy and within reach for average users, not just programmers.

Here is an example of how you can make use of this:

Your development organization uses Jira for scheduling programming work and your marketing organization uses Projectplace to manage their projects. Let's say new features in your product should be communicated to your customers when they are ready to be delivered. Using a Zapier integration between Projectplace and Jira, the development team will be able to trigger timely creation of new, corresponding cards on the marketing team's Projectplace boards. And, when the marketing task reaches a certain state on Marketing's board, a notification to #Slack can be triggered to allow the development team to receive automatic updates about the progress on Marketing's board in Projectplace. Programmers can continue using Jira and #Slack, and the

Send messages on Slack for new cards on Projectplace

USE THIS ZAP

marketing organization can focus on what's going on in Projectplace, the tool they love to use.
